SUMMARY

Product manager with six years across product and delivery, building platforms in regulated, high-consequence environments: national medical licensing, agricultural lending and enterprise operations. Works from an ambiguous problem statement through discovery to a production system, usually with small engineering teams. Writes SQL against production data, owns integrations with external institutions, and has made AI a working part of how a product team operates. Product title since 2025; the six years span product, business analysis and programme management. Based in Lahore, open to Islamabad and fully remote roles.

EXPERIENCE

Waseela Global — Product Manager, Agri & Enterprise Mar 2025 – Present

- Own thirteen systems on a Frappe/ERPNext platform serving 40,000+ users and 150 field staff — credit origination, procurement, warehouse receipts, production, laboratory, assets, HR and finance — after consolidating an in-house operations app, an Odoo instance and a sprawl of spreadsheet trackers onto one platform with a single source of truth.
- Designed a crop credit product in which repayment is netted at harvest settlement rather than collected afterwards, making recovery a property of the transaction: PKR 150M+ deployed across 3,069 acres, PKR 540M+ of crop sales routed through the platform.
- Selected and negotiated Faysal Bank as financing partner, then designed the data flows and reconciliation logic between their Shariah-compliant warehouse receipt product and the EWR system built in-house. Live 5 July 2026; approval to disbursement fell from roughly seven days to same day. MoU covered in Dawn, February 2026.
- Reverse-engineered the in-house wallet and ledger system and found its NFC and OTP verification fields carried no server-side enforcement — a control present in the schema but absent from the code, across a large volume of already-settled cashouts.
- Built offline-first field workflows after ride-alongs identified the product, not training, as the blocker: 80%+ of transactions captured on-device, data lag from days to same day. Ran discovery directly — farmer interviews, a 36-role user inventory, staged pilots — and trained 500+ farmers in Urdu across Jhang and Chiniot.
- Replaced paper-diary milk collection, where field teams were bypassing the system because entry was slow and collection points had no reliable connectivity, with a QR-driven capture flow running on staff's own phones under a no-hardware-budget constraint: scanning a reusable coded bottle or butyrometer determines the screen, so agents and officers never select one. Quality checks fire at random rather than on request, every fat reading is bound to the tester who ran it, and collection reconciles against litres actually sold.
- Introduced AI into the product operating model: PRD generation from live codebases, requirement analysis from screenshots, and an access layer over the ERP letting product managers query the system directly. Specification cycles fell from weeks to days. Deliberately excluded from credit decisioning.
- Built and deployed four internal products solo with no engineering allocation, all in production: the electronic warehouse receipt system, an AI-enabled farm management system, a laboratory dashboard and an executive dashboard.

Waseela Global — Technical Project Manager / Scrum Master Feb 2024 – Mar 2025

- Ran Agile delivery across the product and engineering organisation, establishing the sprint cadence, release process and hiring pipeline still in use. Promoted into product ownership in March 2025.

DCore — Technical Program Manager Sep 2023 – Jan 2024

- Designed the delivery model for the AgriTech and FinTech lines across eight engineers, and standardised technical onboarding and offboarding.

Rayn Group — Business Analyst → Technical Program Manager Mar 2023 – Aug 2023

- Foundational team member of Kisaan, the platform later incubated as Waseela. Led requirements for Digital Digest, digitising the judicial database of the Supreme Court of Pakistan.

Pakistan Medical Commission — Business Analyst (acting manager, software team) Mar 2021 – Feb 2023

Federal regulator of medical and dental education in Pakistan.

- Led a team of 25 across engineering, QA, design and operations to build Pakistan's first digital medical licensing and examination infrastructure, with audit trails treated as a first-sprint constraint rather than a pre-review retrofit.
- Over 200,000 practitioners now license online. Turnaround fell from more than a month to under three days, physical visits by roughly 95%, and a paper backlog of 40,000+ applications was cleared.
- Sequenced licensing first — a practitioner who cannot renew cannot legally practise — and shipped MCB payment and challan collection in the same release as the forms, removing manual bank-slip reconciliation rather than relocating it behind a digital interface.
- Delivered Pakistan's first centralised medical admissions portal covering 97 colleges, credentialing across 128 private medical and dental colleges, and a central complaints system.

SKILLS

Product: Discovery & user research · Roadmapping · PRDs & acceptance criteria · Metrics & cohort analysis · Stakeholder management

Data: SQL against production data · Metabase · GA4 · Frappe/ERPNext reporting · APIs & third-party integration

Tools & Delivery: Figma · Miro · ClickUp (power user) · Linear · Basecamp · Agile delivery & Scrum · AI-assisted product operations

Domain: Digital lending & payments · Offline-first field products · Regulatory & audit requirements · B2B platform consolidation

EDUCATION & CERTIFICATIONS

Lahore University of Management Sciences (LUMS) — MS Technology Management & Entrepreneurship (on hold)

National University of Modern Languages (NUML), Islamabad — BS (Hons) Mass Communication, 2015 – 2019 · Google Project Management Certificate, 2024
